

Multi Directional Forklift

Used Side Loader Forklift Bellevue - The side loader forklift is designed for lifting heavy cargo in narrow locations including loading docks, lumber yards and warehouse aisles. These machines have derived their name from the way they unload, load and transport material. Benefits of Side Loader Forklifts v Standard Forklifts Forklifts which operate on the standard counterbalance system may become unstable when loading, transporting or unloading heavy, long loads. The side loader is capable of transporting dangerous loads such as piping and timber. Excessive loads including pipes, steel or timber can be handled easier thanks to the design of having the load face the direction of travel. Side loaders offer a safer, unobstructed view for the operator which is a greater improvement over the standard forklift with its front-carrying design and the fork tines. Side loaders can access narrow aisles and tinier doorways with ease since loads are transported down the side of the machine instead of on the front as with a standard forklift. The load may have to be raised on regular forklifts to travel around obstacles that increase the chances of tipping over. A side loader forklift makes much of that maneuvering unnecessary. These units help warehouse locations to manage smaller spaces much more safely. Most side loaders are able to lift up to 12,000 pounds and can travel at speeds just above 5 miles per hour but are often equipped with the ability to program travel speeds. Programmable travel speeds are useful for allowing operators to match speed for particular jobs. Types of Side Loader Forklifts Class 2 - Electric Motor Narrow Aisle Trucks Side loader forklifts are within the Class 2 Electric Motor Narrow Aisle Trucks. This classification, as the title description suggests, encompasses forklifts that operate in narrow aisles and are powered by an electrical source. These are popular in warehouses, covered loading docks and other facilities that use a narrow aisle configuration or require moving between narrow spaces and where long items such as laminates, carpet, bar stock, lumber and furniture are stocked. They are also suited for rack storage and feeding machine tools. The narrow aisle set up is common in warehouses because it allows for the maximum possible use of a storage area which helps to save on costly square footage as well as travel time between material and loading and unloading areas. Class 2 side loader forklifts have been designed to take up less space by the forklift truck. This allows increased efficiency and speed when moving, loading and unloading in narrow aisles. Dangerous internal combustion emissions are eliminated due to their electrical power use, making side loaders excellent for interior applications. Internal Combustion Engine Side Loader Forklifts The Class 2 forklifts only apply to side loaders that use electric power. Units that do not rely on electricity do not fall into this category. Side loaders are common at steel and pipe yards and lumber and timber yards. They accurately transport loads from storage areas including racking, flatbeds, and stacking loads in blocks. These machines that are used outside have to deal with uneven ground and different temperatures. This means an internal combustion engine and, sometimes, pneumatic tires are a better option for the job. Side loaders are especially popular for these types of applications because the weight and length of materials being handled mean that the side loader forklift can maneuver between narrow stacks, piles or aisles to pick up the long load in their middle which is crucial for loading long items and safely transporting them. Side Loader Forklift Design The side loader forklift has two kinds of designs, sit down models or stand on models. Stand On Side Loader Forklifts Stand-on side loaders are often seen in interior locations. It consists of a platform area that is surrounded by controls and usually found in the middle of the machine. The stand on unit has many advantages. The stand on side loader does not require a seat for the operator which allows for a smaller cab design. This creates a forklift with a smaller footprint which is advantageous for traveling within confined locations. Especially while operating in reverse, there is greater operator visibility from a standing position. Operators have a better view while standing and reversing compared to having to twist their body, back and neck to see as with a sit-down unit. There are more safety and operator comfort in the stand-up side loaders, ensuring better visibility and less potential for damage or injury. Operators can get onto and off of the stand up forklift faster compared to a sit-down model and this may increase efficiency in

certain situations. **Sit Down Side Loader Forklifts** Sit-down loaders are more popular than standing loaders. Similar to the side loader stand, the sit-down unit features a centrally located cab. The difference that a sit down forklift has is a raised platform with a seat facing the forklift's control panel. The sit-down units boast better operator comfort. The machine enhances productivity and reduces fatigue when operators can work from a resting position. **Customizable Features** Because of the wide range of jobs that use side loader forklifts, the side loader is available in customizable bed lengths. Custom applications can be met on the job with a sixty-inch extension to further the reach of standard bed length side loaders. However, when customizing a side loader feature such as the bed length, consideration must be given to the width of aisles at the relevant jobsite as guide rails and aisles may need adjusting to accommodate the extra sized forklift, which is likely to affect budget and productivity. One popular feature for these forklifts is multidirectional capability. These side loaders have crab steering which allows two wheels to operate independently from the others. This feature allows the side loader to move in all four directions by changing the direction of the wheels, allowing the forklift to move sideways into narrow storage aisles without making large, swing-out turns or multiple adjustments. The smaller turning radius increases safety while decreasing damage to product and facilities. More efficiency is attained since there is less space and time needed to move around the job site. Numerous side loader features can be customized to suit a job site. Customizable options include lift capacities, lift mast heights, tine length, mirrors, lights and more. Certain features are also adjustable, allowing for further customization of the side loader for the particular job application. Travel speed, acceleration time, load limits and braking force can all be set allowing further job efficiency and increased workplace safety. For all of the above reasons, the side loader forklift has become the most popular option for workplaces where space is limited and long loads are involved.
